

Blind Nut Insertion Into Deep Box

Blind nut insertion into deep box

Description of Application:

Customer's cabinet required insertion of blind nuts into various locations which could not be reached with a single tool design.

Customer Requirement:

Insert all of the one type of fastener in a single handling of the part.

Haeger Solution:

Haeger's Custom Tooling Group developed a low-profile lower tool holder with two tools to access the fasteners in the cabinet. The tools have a "storage" location at the rear of the tool holder and can easily be set in place at the front of the tool holder.

Customer Benefit:

Operator can install all the blind nuts in the cabinet without letting go of or putting down the part – cutting the total handling time of the part in half.
