Preface

Copyright 2024 by PennEngineering®, Inc. All rights reserved.

No part of this documentation may be reproduced, copied or transmitted in any form, or by any electronic, digital or other means, without permission in writing from PennEngineering®, Inc. (referred to herein as the “Company”). This includes photocopying and information storage and retrieval systems. The material in this documentation is subject to change without notice.

PLEASE READ THESE TERMS AND CONDITIONS CAREFULLY BEFORE USING THE SOFTWARE INCLUDED WITH THE EQUIPMENT. BY USING THE SOFTWARE ACCOMPANYING THE EQUIPMENT YOU AGREE TO BE BOUND BY THE TERMS AND CONDITIONS OF THIS LICENSE.

All software furnished with the equipment is on a licensed basis. The Company grants to the user a non-transferable and non-exclusive license to use such software in object code only and solely in connection with the use of the equipment. Such license may not be assigned, sublicensed, or otherwise transferred by the user apart from the equipment. No right to copy a licensed program in whole or in part is granted. Title to the software and documentation shall remain with the Company. The user shall not modify, merge, or incorporate any form or portion of a licensed program with other program material, create a derivative work from a licensed program, or use a licensed program in a network. The user agrees to maintain the Company’s copyright notice on the licensed programs delivered with the equipment. The user agrees not to decompile, disassemble, decode, or reverse engineer any licensed program delivered with the equipment, or any portion thereof.

LIMITED WARRANTY: The Company warrants only that the software will perform in accordance with the documentation accompanying the equipment during the equipment warranty period. The Company does not warrant that the software is error free. The user’s exclusive remedy and the Company’s sole liability for defects in the software as to which the Company is notified during the equipment warranty period is to repair or replace the software at the Company’s option. This limited warranty does not apply if the software has been altered, the user has failed to operate the software in accordance with this documentation, or the software has been subject to abnormal physical or electrical stress, misuse, negligence or accident.

EXCEPT FOR THE EXPRESS WARRANTY SET FORTH ABOVE, THE SOFTWARE IS PROVIDED “AS IS” WITH ALL FAULTS. THE COMPANY DISCLAIMS ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL THE COMPANY BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THE EQUIPMENT, THE SOFTWARE OR ANY PART OF THIS DOCUMENTATION, EVEN IF THE COMPANY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

SECTION 1 INTRODUCTION

Use:

- This equipment is used for the riveting of some PEM screws, nuts and studs fastening products.
- This equipment is composed of a touch screen, a safety punch, a feeding system, a tooling fixture and an XYZ high speed mobile platform. The product to be riveted can be sent to the tooling fixture through the feeding system as required, and the product to be riveted can be riveted through the safety punch Press to the workpiece to complete the riveting process.
- According to different processes and workpieces, the tooling fixtures corresponding to different products can be replaced automatically to achieve the purpose of riveting and connecting different products.

Features:

- Unique precise pressure riveting force and energy-saving riveting power consumption.
- Computer control system with touch screen interface.
- The riveting algorithm is intelligent, can display the pressure-position curve, and has the function of parameter memory and curve memory.
- Provide simple and precise control for operators. The design of the machine setting, operation, maintenance and fault diagnosis is simple and easy to use.

Specifications:

- | | |
|---------------------------------|--|
| • Riveting Force | 8~80kN (1798.5-17984lbs) |
| • Control System | Servo motor system |
| • Repeatability | $\pm 0.5\%$ pressure accuracy
$\pm 0.02\text{mm}$ position accuracy |
| • Air requirements | 6~7bar
$\Phi 12$ mm dia. minimum line flow |
| • Depth | 2700mm |
| • Width | 4300mm |
| • Hight | 2400mm |
| • Weight | 4300kg |
| • Electrical | AC400V (+/ - AC 23 V) , 50Hz |
| • Short-Circuit Rating | 5kA |
| • Air Consumption | approx. 2 liters/sec air at 1 Atm (15 Scfm) 6 insertions per minute |
| • Electrical Power Consumption | 13kW |
| • Ambient Temperature | 5°C~40°C (41°F ~ 104°F) |
| • Transport/Storage Temperature | -13°F to +130°F (-25°C to +55°C) and for short periods not to exceed 24 hours up to 160°F (70°C) |
| • Ambient Humidity | 30% ~ 95% (Not reflective of inlet air) |
| • Installation Altitude | Max 1000m |

- Installation requires horizontal installation on load-bearing ground
- EMC requires Do not allow a lot of electromagnetic interference around
- Light requires adequate illumination at the operating points and areas

FIGURE 1-1

Dimensions of PAT600-E Hardware insertion machine

SAFETY

The Rivet Installation Machine PAT12000-E was designed to conform to applicable ISO, ANSI, OSHA, CEN and CSA safety standards.

The Rivet Installation Machine PAT12000-E is compliant to applicable European Union (EU) directives and bears the CE Mark.

The Rivet Installation Machine PAT12000-E conforms to the essential requirements of the following directives:

Machinery Directive: 2006/42/EC

Electromagnetic Compatibility (EMC) Directive: 2014/30/EU

Low Voltage Directive: 2014/35/EU

MEASURES TO PREVENT MISOPERATION

- The equipment shall be provided with a permanent, clear and easily identifiable mark or signage. The signs or signs shall have the main characteristics required for safe use of equipment, such as rated parameters, connection mode, grounding mark, danger mark, special operation method and operation conditions, etc.
- Electrical control circuit with emergency stop button specified in safety requirements to prevent the occurrence of misoperation. At the same time, the device is equipped with interlock or limit protection device, safety grating, etc.
- Through the above safety device, if there is any wrong operation, the equipment will stop running in an emergency and send an alarm message the equipment can operate normally only after the warning information is processed.
- Riveting nuts approved by PEM shall be used in this equipment, and riveting workpiece on this equipment shall also be approved by PEM. PEM shall not be liable for any operation accident or loss caused using rivet and rivet pressure parts not approved by PEM.

Please read and follow the safety precautions listed as below.

SAFETY PRECAUTIONS

- ◆ Always use safety goggles when operating or maintaining the rivet installation machine.
- ◆ Ear Protection is recommended.
- ◆ Always shut off the electrical power and remove the power cord before servicing the Hardware insertion machine.
- ◆ Before using the Hardware insertion machine, make sure that a shutoff device has been fitted on the air supply line and the location is easily accessible, so that the air supply to the rivet installation machine can be shut off in an emergency. Make sure that surge protection is installed in the electrical supply to the rivet installation machine.
- ◆ Check the air hose and fittings regularly for wear.
- ◆ Use only approved parts for maintenance and repairs.
- ◆ Do not use chipped, cracked or damaged accessories and tools.
- ◆ Attach airline securely.
- ◆ Keep body parts away from moving parts.
- ◆ Never wear jewelry, loose clothing or anything that could get caught in moving parts.
- ◆ If a new user is operating the pull riveting machine, be sure these instructions are readily available.

- ◆ Do not use the Hardware insertion machine in any way, other than for its intended purposes.
- ◆ Do not modify the Hardware insertion machine in any way.
- ◆ Fasteners are blown at a high velocity. Tubing must always be secured before machine is operated. Check integrity of tubing before use.
- ◆ Non-professionals are prohibited from disassembling this equipment.
- ◆ All personnel operating this equipment must be trained and qualified before they can take up the post of operation.
- ◆ All personnel operating this equipment must be trained and qualified before they can take up the post of operation.

WARNING: Immediately upon receipt of your hardware insertion machine, establish a “Maintenance Code” for your supervisor/maintenance personnel only, as it is possible, however difficult, to operate the rivet installation machine without the standard safeguards in place in the Maintenance Mode. Only trained personnel should use the Maintenance Mode. PennEngineering is not responsible for improper maintenance mode procedures, which result in a loss of operation of the press or operator safety.

Label	Definition
	General Warning Label – There are items that require attention. These are specified in the operator’s manual.
	Eye Protection Label – Eye protection must be worn when operating the press.
	Ear Protection Label – Ear protection must be worn when operating the pull riveting machine.
	Fastener Mandrel Point Label – Keep hands away from area.
	Electrical Shock/Electrocution Warning Label –Electrical shock hazard. Do not touch

WARRANTY

PennEngineering® warrants that this product, when correctly used according to directions and under normal operating conditions, will be free from defects in material and workmanship for a period of one (1) year from the date of purchase.

This warranty shall not apply to any product which has been altered, changed or repaired, normal maintenance excluded, except as authorized by PennEngineering®. This warranty shall not apply to any product that has been subject to misuse, negligence or accident.

The purchaser's exclusive and sole remedy shall be limited to repair, modification or replacement at the discretion of PennEngineering®. In no event shall PennEngineering® be liable for the cost of any indirect or consequential damage. In no case shall PennEngineering® liability exceed the purchase price of the product.

This warranty is exclusive and in lieu of all other warranties. No oral or written information by PennEngineering®, its employees, representatives, distributors or agents shall increase the scope of the above warranty or create any new warranty.

Should any questions or problems arise concerning your rivet installation machine, contact the PennEngineering® Service Department. Toll-free telephone number +86(512) 5726-9310.

Set-up, Training and Repair Service is available to you if you own your rivet installation machine. Free telephone instruction and Service is available for the lifetime of your rivet installation machine by calling the PennEngineering® Service Department.

SECTION 2

MAJOR COMPONENTS OF HARDWARE INSERTION MACHINE

Identify the main components of the Hardware Insertion Machine.

This chapter introduces users to some of the main components of the Hardware Insertion Machine.

Main Frame

The frame is the structure of the hardware insertion machine. The main part of the frame consists of a solid steel structure with welded components forming the foundation, and other supporting parts. All components are directly or insightly installed on the frame.

Electric cylinder

The riveting force of the hardware insertion machine is applied by the electric cylinder, which is directly installed on the frame. The electric cylinder is equipped with a pressure sensor to determine whether the electric cylinder has reached the set pressure during the riveting process. The end of the piston rod of the electric cylinder relates to a safety punch assembly, which will be described in Chapter 3.W

XYZ high speed mobile platform

The three-axis platform drives the product to achieve precise movement in the three directions of X, Y, and Z. The XYZ platform mainly includes the X-axis moving part, the Y-axis moving part, and the Z-axis moving part. The movement of each axis is achieved by the servo motor driving the linear module, and there are high-precision guide rails to assist in guiding, with high repeatability and positioning accuracy.

Operator control

Except for the foot switch and the power switch on the electric cabinet, the operator's main operations are on the control panel on the **PMCS**. These control components include a touch screen, an emergency stop button, a power on button, and a spring reset button.

- **PMCS (PennEngineering machine control system)** -This is the main interface of the hardware insertion machine control system (Programmable Automation Controller (PAC)). The screen is used for system operation, control, parameter setting and automatic feeding adjustment and configuration, user feedback and fault diagnosis. The screen can display text and graphic information and enables the operator to make selections by touching the buttons on different parts of the screen. The program has set the touch screen to automatically enter the screen saver mode when it is idle every 10 minutes and clear the content displayed on the screen. To resume the operation of the screen, just press any key on the keyboard. In Chapter 6 of this manual, the screen display in various situations is explained in detail.
- **Emergency stop button**-Press this button to disconnect the power supply to the quick exhaust/air supply valve (see the air supply input system on page 8). When the pressure is exhausted, all

pneumatic actions are stopped. In an emergency stop condition, all outputs are shut down. The control system remains online and detects the emergency stop signal.

- **Power ON/OFF knob switch**- This knob switch can be used to turn on/off the power to the press control system, if the press power is on, then the green light of the electrical cabinet is on. If the power is cut off, it will also cut off the power of all moving elements including the quick exhaust/air supply valve.
- **RESET button**- Initializes the press, including applying pressure to the press and moving the ram to its retracted “home” position.
- **Foot switch**-The foot switch is a switch used by the operator to control the working cycle of the riveting machine. It frees the hands of the operator and can be used for the operation of the workpiece.

Electrical cabinet

Including different types of electrical components and power distribution terminals. The power switch and the foot switch are connected with the electrical cabinet. Electrical cabinet door latch with a key, is an electrical switch cabinet side. The electrical switch must be turned on (ON) before the riveting machine can be started. Once this switch is turned off, all power to the riveting machine is cut off. The plug of the power cord is inserted next to the switch. By unplugging the power cord, all power supplies of the riveting machine can be shut off during maintenance.

Vibration feeding system

The vibrating feed system on the left side of the hardware insertion machine is used for the automatic feeding of fastened riveting parts. It is an electric drive device that can hold and move 8 different types of fastening products. Connected to the vibrating plate are various types of tools so that the fastening rivets sent out of the hopper have their own directions of movement.

- Vibrating feeding controller-the amplitude or frequency of the vibrating plate is controlled by the vibrating feeding controller. The adjustment of amplitude and frequency is used to control the feeding rate and carry out the automatic feeding process.

Upper mold changing mechanism

It consists of servo motor, linear module, slide cylinder, guide rail, buffer, material pipe, material pipe joint and carrier. Different types of PEM standard products correspond to different carrier platform tools. The upper mold change mechanism automatically switches to work with the corresponding feeding system and lower mold change mechanism.

Lower mold changing mechanism

It is composed of servo motor, screw module, pen-shaped cylinder, guide rail, buffer, and lower mold. Different types of PEM standard products correspond to different lower mold tooling, and the lower mold change mechanism automatically switches to work with the corresponding feeding system and lower mold change mechanism.

Binocular vision guidance system

The binocular vision system is mainly composed of two sets of camera lenses, light sources, and image processing industrial computers. It uses binocular vision technology to achieve precise positioning of workpieces and guide the XYZ mobile platform to move the product to the exact position where riveting is required.

SECTION 3

SAFETY SYSTEM OPERATION

WARNINGS - To avoid injury:

1. Always shut off the electrical power, and remove the power cord, before servicing this machine.
 2. Only authorized and trained personnel should maintain, repair, setup, or operate this equipment.
 3. Always use eye protection when operating or maintaining the pull riveting machine.
-

3.1 SYSTEM SAFETY FEATURES

1. Turning off the electrical power, with either the “OFF” push-button, the ON/OFF switch, or pushing the E-Stop button, will cause the electric quick exhaust/supply valve to exhaust all air pressure in the rivet installation machine. **WITHOUT ANY CONTAINED PRESSURE, ALL PNEUMATIC MOTION STOPS.**
2. The electrical cabinet has been locked with a key to prevent unauthorized personnel from opening it.
3. Has a first-level password protection measure for safe access.

3.2 SECURITY OF USAGE MODE

The Safety System relies on the Dual Safety Sensor inside the Cylinder Ram Adapter, and position monitoring fulfilled by the Tooling Protection System (TPS). The Upper Tool Holder Retainer Screw secures the Upper Tool Holder to the Cylinder Rod. There is a black serrated knob on this Retainer Screw. It enables the Upper Tool Holder to move up on the Cylinder Ram Adapter .45 in/11.4 mm. To move up, the Upper Tool Holder must overcome the light force of the Continuity Spring.

If the Upper Tool Holder moves up .015 in/0.4 mm to 0.02 in/0.5 mm, the Safety Sensor will lose the target in the upper tool holder. Sensors should change state simultaneous otherwise the machine will bring the ram up.

Before each cycle the state of the 2 sensors in the ram adapter are monitored by the dedicated Safety Controller to ensure the upper tool holder is installed, and in released state.

In operation, when the Safety Sensors is actuated in Conductive Mode and a non-conductive material is between the Upper and Lower Tools, the Upper Tool Holder’s downward motion is reversed immediately and returns to its Up position. If the Safety Sensors is actuated and a conductive material is between the Upper and Lower Tools, the machine will continue the hardware insertion cycle if inside the TPS window. The machine will apply the set down force to the conductive material between the Upper and Lower Tools and then return to its Up position.

Risk of crushing-A high risk crushing hazard is created by the Upper Tool and Lower Tooling.

Warning-Safety of the operator in non- conductive access operation must remain accessible only to trained and authorized personnel that are experienced in appropriate machinery operating conduct.

Do not operate this machine while wearing any metal objects (i.e., rings, watches, bracelets, etc.) that may come into contact with the Upper Tool, Lower Tool or work piece.

WARNING: Immediately upon receipt of your hardware insertion machine., establish a “Maintenance Code” for your supervisor/maintenance personnel only, as it is possible, however difficult, to operate the press without the standard safeguards in place in the Maintenance Mode. Only trained personnel should use the Maintenance Mode the PennEngineering® is not responsible for improper maintenance mode procedures which result in a loss of operation of the rivet installation machine. or operator safety.

3.3 Safety System Tests

Step 1: Safety Switch Test Procedure

WARNING: Experienced personnel must test the Safety System at the beginning of each work shift. See the Safety System Test in this section of this manual.

Depending on the ambient shop temperature, you may need to warm up your Hardware Insertion Machine before beginning any operations. To do this, turn it on and let it run for about ten minutes.

1. Turn the *Main Disconnect Switch* to the *On* position. The Main Disconnect Switch is located on the electrical cabinet to the right side of the machine.
2. Start the machine by pressing the On Switch on the touch screen control panel. The green light in the switch will be displayed and the motor will start. If the machine doesn't turn on, twist the Off/E-Stop Switch(s) clockwise until it pops out and try pressing the On Switch again. Using the touch screen controls, select the Conductive operation.

Except for the Down Footswitch and the *Off/E-Stop Switch*, all the other operating controls referred to in the rest of this procedure are on the Touchscreen Panel. The Touchscreen Panel is located on the front of the machine cover.

3. Set the Up Travel distance to 40% by touching the touch screen containing the Up Travel value and then choosing 40 from the entry screen. You can also use the +/- buttons.
4. Keep your hands away from the Tool Holder area. Use the Footswitches to lower or raise the Upper Tool Holder until it is about 4 in. /100 mm above the Lower Tool Holder. Remove your foot from the Footswitches and keep your feet away from it.
5. Carefully grasp the sides of the Upper Tool Holder and push it upwards. This upward movement should actuate the Safety Sensors and the Upper Tool Holder should move up. The movement will continue until the RAM reaches top of stroke. Remove your hand from the Upper Tool Holder as soon as the movement starts.
6. If the RAM moves up, the Safety System Sensors are operating.
7. If the Upper Tool Holder does not move up, the Safety System has failed!

Immediately turn the machine off by depressing the *E-Stop* button and turning the Main Disconnect Switch to the *Off* position. Contact your Supervisor. The machine's Main Disconnect Switch must be locked in the *Off* position until repairs are begun and follow Lock-out/Tag-out procedures. Do not operate this machine until qualified personnel have repaired the machine and the Safety System Sensors has been properly tested.

WARNING: There are two Steps in this testing procedure.
Do not skip or ignore any of them!

Step 2: Non-Conductive Mode Test

1. If you have just completed Step 2:
 - a) The machine is On and the green light in the On Switch is still illuminated. If not, return to Step 1 Safety Sensors test procedure and restart the machine by following Instruction in Steps 1 and 2.
 - b) The Conductive/Non-Conductive mode is displayed in the Conductive selection. Select Non-Conductive from the touchscreen display.
 - c) The machine's Force has been set to deliver 13KN. If this has been changed, repeat the instructions in Step 2, Instruction 4.
 - d) Verify the 1 in/25 mm Flat Anvils are installed in both the Upper and Lower Tool Holders.
2. Keep your hands away from the tooling area. Depress the Down Footswitch. The Upper Tool Holder should move down, the flat Anvils will contact, and the Upper Tool Holder should stop immediately. If this machine completes the above sequence correctly, go to Instruction 4.

WARNING: When operating this Hardware Insertion Machine in the Non-Conductive Mode, be very careful! Do not depress the Down Footswitch a second time after the Upper Tool Holder has stopped on the down stroke with any part of your body near the tooling area.

- a) If the machine does not complete the above sequence correctly, check the touch screen settings. If they are not correct, reset them and repeat the test. If the machine performs correctly, go to Instruction 3.
 - b) If the machine does not complete the above sequence correctly, there is a failure in the machine's control circuit and it must be corrected by qualified personnel. Immediately turning the machine Off by pressing the red Off Switch and turn the Main Disconnect Switch to the Off position. The machine's Main Disconnect Switch must be locked in the Off position until repairs are begun. Do not operate this machine until qualified personnel have repaired the machine and the Non-Conductive Mode has been properly tested.
3. Remove your foot from the Foot pedal switch box.
4. Carefully grasp the sides of the Upper Tool Holder and raise it until a positive stop position is reached. With a calibrated measuring instrument (Digital calipers are best), measure the vertical distance between the upper and lower Anvils. If this measurement is **at least a minimum of 1/4 in. /6 mm**, go to Instruction 6.
 - a) If this dimension is less than 1/4 in. /6 mm, **the Safety System has failed!**

Immediately turn the machine off by pressing the red Off Switch and turning the Main Disconnect Switch to the Off position. The machine's Main Disconnect Switch must be locked in the Off position until repairs are begun and follow Lock-out/Tag-out procedures. Do not operate this machine until qualified personnel have repaired the machine and the Non-Conductive Mode has been properly tested.
5. Next keep your hands away from the tooling area. Turn machine back "ON" and depress the Down Foot pedal switch a second time. The machine should exert the pre-set 13KN force to both upper and lower Anvils and then return to its Up position.

If this machine completes the above sequence correctly, the test of the Safety Sensors and Safety System is complete and operating properly.

**There are two Steps in this testing procedure.
Do not skip or ignore any of them!**

SECTION 4

INSTALLATION OF HARDWARE INSERTION MACHINE

Transportation of the hardware insertion machine

- When using a forklift or pallet jack be sure that the forks are properly located between the fork guide tabs under the base of the hardware insertion machine. (See Fig 4-1)
-

WARNING: Unbalanced loading of the hardware insertion machine or sudden stops may lead to toppling of the hardware insertion machine.

Locating the Hardware Insertion Machine

- Select a well-lit clean area with a (relatively) level floor. The floor must be able to support the weight of the Hardware Insertion machine.

Leveling the Rivet Installation Machine

- The hardware insertion machine should be leveled and stabilized after it has been located. This is done by adjusting the height of each footpad then locking each footpad in position by tightening a jam nut. This task requires two 36mm wrenches (See Fig 4-2). An adjustable wrench may also be used. Adjust the foot pad while reading the level at the tooling nut gate adapter. The universal escapement adapter must sit level for proper functioning of the feed systems.

Open Space Requirements

- PennEngineering® has no specific requirements for providing open space around the perimeter of the hardware insertion machine. However, be sure to comply with any national or regional safety codes that may dictate otherwise. We do recommend that you at least leave enough space around the hardware insertion machine so the various storage and maintenance enclosures can be opened fully and so the largest workpieces can be accommodated.

Original Installation Requirements

- After the final installation of the hardware insertion machine verify the continuity of the protective bonding circuit (TN-System) in accordance with EN 60204-1 Clause 18.2.2 standards.

FIGURE 4-1
Move Location Diagram

FIGURE 4-2
Adjustable Footpad

Recommended Air Supply Hook-Up Arrangement

Proper air supply is very important to the performance and maintenance of the hardware insertion machine. Following these simple guidelines will ensure good machine performance.

- **Air Quality** - The quality of the air supply is very important. The air must be clean and dry. Moisture and debris will contaminate the oil and valve systems and lead to machine performance and maintenance problems.
- **Air Supply Flow** - Use a minimum 12mm diameter line and fittings from the compressed air source to the rivet installation machine. Shop pressure ranging between 6 to 7 bar (90 psi to 100 psi) is acceptable. Inadequate air flow will affect machine performance.
- **Air Consumption** - Air consumption in automatic mode is about 2.5 liters of compressed air per cycle. Average air consumption running at 6 insertions per minute is about 0.3 liters/sec at 1 atm.
- **Piping Installation** – Proper piping hookup will help achieve the above requirements. See Figure 4-3 on the next page.

- ◆ Connect to your supply line with a pipe pointing upwards that curves over and down. This arrangement will help prevent water and compressor oil from entering the machine.
- ◆ Connect to that drop with your supply fitting for a 12mm or larger hose.
- ◆ Continue the end of the drop to a drain valve. This will help collect additional water and oil and allow the system to be purged.
- ◆ If your factory air supply falls short of the above recommendations, an air reservoir tank of an appropriate size for your location can be used.
- ◆ An auxiliary filter/separator installed immediately outside the machine is recommended.

**FIGURE 4-3
AIR SUPPLY**

SECTION 5

GENERAL FUNCTION DESCRIPTIONS

System Function:

The function of **PEMSERTER® PAT1200-E Hardware Insertion Machine** is to safely, quickly and consistently install riveting screws, nuts or studs for various types of plates. In order to achieve this function, the riveting machine adopts the following technologies and devices:

- Precise computer-controlled pressure riveting force and pressure riveting position.
- The automatic feeding system and Multi-Shuttle platform tooling can be selected according to the needs, and the product to be riveted can be positioned on the Vacuum Anvil (upper die), so that the operator can be released and can operate the workpiece freely.
- The system supports up to 8 different types of PEM fasteners mounted on one panel.
- Installation process monitoring, support curves, optional internal or external stored process curves.
- Automatic replacement of upper and lower punches.
- The binocular vision guidance system supports high-precision positioning and installation.

Setting up the Hardware Insertion Machine:

The following section of the manual describes the setup process in general. For details on setting up and operating the Hardware Insertion Machine see the appropriate section in the manual.

Step 1: Choice of tooling

The selection of tooling includes selecting suitable tooling for the delivered products and workpieces to be pressure riveted, including the tooling used for pressure riveting tooling and feeding control. The specific tooling type can be inquired through the website <https://www.haeger.com/ATW> or Haeger Wizard APP or consult the PEMSserter technical department.

Step 2: Select the Setup for the Tooling and Riveting Fastener on the Touchscreen.

Once the tooling is installed, the next step is to setup the rivet installation machine by using the touchscreen. The touchscreen setup is simple and can be done one of three ways.

- **Choice of tooling**-Choose tooling mode, riveting fastener size and types
- **Call pre-stored pressure riveting parameters**- Select from a previously programmed Job stored in the rivet installation machine.
- **Call the parameters of the last pressure riveting**-Call the same operating program that the riveting machine just ran last time, even after the shift is selected, the Hardware Insertion Machine will automatically set the operating variables and continue to perform security settings.
- **Manually set the pressure riveting parameters**-according to the needs of the product, manually set the pressure riveting parameters

Step 3: Safety Setup

The next step is very quick and simple but very important.

In the step of security setting, the Hardware Insertion machine needs to set the trigger position of the "safety trigger point" in the "Tooling Protection System (TPS)". The operator places the workpiece and the product to be riveted, but the riveting machine does not perform the actual operation of the product to be riveted. Step on the foot switch to make the hydraulic cylinder move slowly down. When the safety punch assembly touches the workpiece to be riveted, press the riveting product and trigger the safety punch assembly. At this time, the machine will record the position. This contact point is the correct trigger position and pressure position obtained by the riveting machine. At this point, the riveting machine is ready for pressure riveting operation.

Riveting Automatic Feed Functions:

The automatic feeding function is completed by the vibrating feeding system and the storage system sending the products to be riveted into the multi-carrier platform tooling through the feeding tube. Take the following steps:

- The vibrating feed system moves the riveting product to the edge of the vibrating tray and transmits it to the Multi-Module.
- The direction of the riveting products is determined in the multi-module dislocation mechanism and sent to the Multi-Shuttle through the Tube. The riveting products to be riveted will be taken away by The Vacuum Anvil (Upper mold) through vacuum adsorption, and then be pressed into the workpiece. In the vibrating feeding system, the rest of the tightened riveting products with incorrect postures are blown out of the Multi-Module by compressed air and returned to the storage vibrating tray.

Pressure riveting process:

- When the riveting product contacts the workpiece, the riveting machine judges the position of the "safety trigger point". Only when the safety trigger point is within a certain deviation range, can the pressure riveting process continue.
- If the safety trigger point is correct, apply pressure riveting force to the riveting product, and then the Anvil exits and returns to the origin.

SECTION 6

TOUCH-SCREEN CONTROLS

A programmable Automation Controller (PAC) controls the functions of the Device. The operator sends commands to the PAC and reads data from the PAC through a system of menus and information displayed on its touch screen. An operator need only touch the buttons displayed on the touch screen to make a selection.

The touch screen controls allow the operator to setup the Hardware Insertion Machine for operation, operate special functions and maintain and troubleshoot the machine.

6.1 Main Screen

When system finish loading software 'Main Screen' will show.

Y axis parameter page

Z axis parameter page

Base mold axis parameters page

Enter avoidance mode.

Z-axis reference calibration.

Matrix function Not available

"Point Jump" function.

Not available: Laser calibration

Platform initialization available.

Adjustment operations for moving drawing coordinates and compensation after taking photos can be performed.

Operations such as camera photography and reset alarms can be performed.

Press machine riveting operations can be performed.

Note: Ensure that the platform is in a safe position or at the riveting position before performing

After selecting 'Specify Hole Number,' click '② Go to Specified Hole Number Position,' and the platform can be moved.

After moving to the specified hole number and taking an OK photo, the platform can be shifted to the riveting position.

Manually specify a hole number to move directly to it. The corresponding 'Template Number' for the hole number will be displayed synchronously for camera photography use.

This mode function is disabled.

Before taking the photo, the platform needs to be raised to the photo-taking height.

⑥ Move to Hole Number Riveting Position: After visual compensation of the XY platform, it can be lowered!"

6.9.3 Homepage Display Overview

6.9.4 X-Axis Operation Page Overview

6.9.5 Y-Axis Operation Page Overview

6.9.6 Z-Axis Operation Page Overview

6.9.7 Bottom Mold Operation Page Overview

6.9.8 Avoidance Mode Operation Page Overview

In Avoidance Mode, the motor can automatically move to a pre-set avoidance position to facilitate maintenance on the turret and other locations.

- ① : Activate Avoidance Mode.
- ② : Press the button three times consecutively to move to the avoidance position.
- ③ : After three presses, return to the position before avoidance.

In non-avoidance mode, you can also operate the single axis to the corresponding position and re-save to record the new position.

6.9.8 Jump Point Function Page Overview

Enter the 'Jump Point' screen to activate the jump point function. If 'Continuous Jump Point Mode' is not activated, the device will automatically turn off the jump point mode after completing one production cycle. If 'Continuous Jump Point Mode' is activated, the specified jump point mode will be executed in each subsequent cycle until manually canceled.

You can set a specified jump point code. For example, if jumping from point 5 to point 13, the device will start production from point 13 after completing production at point 4, skipping points 5 through 12.

SECTION 7

PNEUMATIC SYSTEM

A. The initial pressure input of the pneumatic system

- Your factory air supply should be clean, dry and, ideally, have a high flow capability. Airline feeds smaller than 12mm (1/2") will increase cycle time.
- Factory compressed air, set between 6 and 7 bar (90 to 100 psi), enters the system through a manually adjusted filter/regulator.

After flowing through the air filter pressure reducing valve, the air is connected to two valve islands through a $\Phi 10$ pipe, and the valve plates on the valve islands control each pneumatic actuator (see pneumatic principle diagram 7-1).

B. Air discharge

Both sides of the pneumatic valve assembly plate are equipped with exhaust holes and are equipped with silencers. According to the action logic needs, the air is discharged from this.

SECTION 8

ELECTRICAL SYSTEM

WARNING: Device uses high voltage electrical power. Only trained and authorized personnel may attempt to maintain, service, or repair its electrically powered subsystems, components or parts.

The electrical panel enclosure requires a special key to open. The purpose of this feature is to protect the machine from unauthorized persons tampering with the system and to help prevent unauthorized and untrained personnel from receiving an electrical shock. We suggest the key be kept by a manager/supervisor who will properly control its use.

Please refer to the drawing description for details.

AC Power Distribution:

The device is protected by a four-pole main circuit breaker. The orange line means there is still power after the power is off.

The inline AC power entering the device is routed to the following 2 areas:

- AC power supply
- Maintenance electricity.

DC Power Distribution:

- DC power supply from the main power supply for the programmable controller. Through different sub-circuits, it also supplies power to sensors and other input signals, touch screens, and programmable controllers that are used to control output drive cards for different load (output) switches.
- Light power.
- Motor, driver, Relay, Cylinder.

SECTION 9 MAINTENANCE

The most important element of maintaining your PEMserter® rivet installation machine is to ensure that the compressed air supply is clean and dry. Do not use lubricated air. It is necessary to ensure the cleanness of the liquid drawing oil, do not open the filling port, and check the fastness of each pipe joint regularly.

Following the maintenance schedule below will also help maintain your hardware insertion machine in good running order.

IMPORTANT: Only qualified individuals should perform maintenance procedures. Unless otherwise specified, perform all maintenance with the hardware insertion machine disconnected from air and power. Follow safe practices and obey all local safety regulations.

Daily Inspection

• Safety punch system components.	• Perform safety system check procedures using “Testing the Safety System”.
• Upper Tool Holder.	• Replace Risk of Crushing label if peeling or damaged.
• Check the Multi-Module.	• Check whether there are impurities in the Multi-Module of the vibrating feeding system and whether it needs cleaning.
• Check air pressure.	• Check inlet pressure of 0.6MPa.
• Check the sound of the device working.	• Check the device is running without sound.

Weekly Inspection

• Check the Multi-Shuttle platform and its cylinder	• Correct and test the concentricity of the Multi-Shuttle platform with the upper and lower molds. • Check the smoothness of the sliding table cylinder.
---	--

Monthly Inspection

• Upper Tool Holder	• Upper Tool Holder. • Small amount of lithium grease (white) between upper tool holder & cylinder rod.
---	---

Six months Inspection

• Shuttle Jaws of Multi-Shuttle.	• Inspect Springs and change out if they appear weak.
• Flight Tubes	• Inspect and change out if damaged.
• Grease the cylinder	• Inject a certain amount of Shell Gadus S2 V2202 grease into the cylinder.

Annual Maintenance

• Clean Air Valves (optional)	• If contaminant build up occurs, clean the pneumatic valves annually. • If wear is serious, replace the pneumatic valve.
• Check the condition of the cylinder	• Make sure the connections are tight and the wires are not frayed or broken, which could affect the proper functioning of the electric cylinder.

3 Year Maintenance

• Check PAC status and clean the PAC. • Replace the button battery of touch screen PC.	• Checking the PAC and replacing the button battery of touch screen PC can avoid an accidental loss of the program. When clean the PAC and replace the button battery of touch screen PC, the machine should be powered off.
--	--

SECTION 10

TROUBLESHOOTING

Note: If an internal PAC problem should develop, call a PennEngineering® service technician, please call +86 (512) 5726-9310.

SYMPTOMS	DIAGNOSTICS & PROBABLE CAUSE(S)	PROBABLE SOLUTION(S)
A. Whole System Malfunctions		
1. The machine will not start. (OFF light not lit) The machine will not start. (ON light is lit)	a. Electrical disconnect turned off. b. No power to the machine. c. DC Power Supply failure.	a. Turn on the power. b. Check main fuses. c. Check DC Power supply, replace if faulty.
	a. OFF button is “open”. b. ON button is not closing. c. MCR (Main Control Relay) system failure.	a. Check button, replace if faulty. b. Check the wiring continuity, replace if faulty.
2. The machine will not cycle.	a. Safety sensor inputs are on. b. Start button is not making the proper PAC input.	a. Check the wiring of the sensor b. Check the wiring of the start button. If it is faulty, it should be replaced.

SYMPTOMS	DIAGNOSTICS & PROBABLE CAUSE(S)	PROBABLE SOLUTION(S)
B. Electrical/Electronic Malfunctions		
1. The touch screen will not work but the power button is lit.	a. The circuit breaker is open.	a. Analyze and repair the touch screen related circuitry then replace the fuse. b. Replace the touch screen if faulty.
2. The lights of the programmable controller are not on.	a. Check to see if the PAC power supply is receiving 24 volts. b. Check the fuse in the PAC power supply. c. Check to see if the PAC power supply has failed.	a. If not receiving power check breaker. b. Replace the breaker in the power supply. c. Replace the power supply.
3. The sensors are not functioning.	a. Check to see if breaker is open. b. Check all sensors to see if one has a "short." c. Check the DC input module.	a. If open, investigate the circuitry and replace fuse three. b. Repair the "short" problem and/or replace the sensor. c. If faulty, replace the DC input module.
4. The DC power supply is not functioning.	a. Check the main power breaker. b. Check for line voltage at the supply terminals.	a. Replace if blown. b. Check the wiring between the power inlet module and the supply. c. Replace the power supply.
5. The machine will not power-up.	a. Check to see if there is incoming power. b. Check to see if the main disconnect is shut off. c. Check MCR's wiring.	a. Provide the power. b. Turn to the ON position.
7. The machine will not power-down.	a. Check to see if the OFF button is faulty. b. check MCR's /wiring.	a. Replace if faulty.
8. There is no voltage at the solenoid valve.	a. Check for a shorted coil. b. Check the related PAC output voltage.	a. Repair or replace. b. Replace the output card if faulty.

SYMPTOMS	DIAGNOSTICS & PROBABLE CAUSE(S)	PROBABLE SOLUTION(S)
C. Pneumatic System Malfunctions		
1. The air pressure does not reach the set value.	a. Check for leaks.	a. Repair any leaks.
D. Tooling Malfunctions		
1. The Multi-Module is jammed.	a. A fastener is jammed.	a. Clear the fastener.
2. Fastening and riveting products are not normally sucked out from the Multi-Shuttle tooling by the vacuum pressure rod.	a. Multi-Shuttle tooling uncalibrated center.	a. Recalibrate Multi-Shuttle tooling.
3. The long lengths of studs are jamming in the tube.	a. Bends in tube are too tight.	a. Redress tube to bend toward the frame and then through the tube clips on the frame.
E. Vibratory Bowl System Malfunction		
The bowl does not vibrate.	a. Check whether the circuit breaker of the vibrating plate drive controller is intact. b. Check whether the output signal light of the programmable controller is on. c. Check whether the internal circuit of the feeding drive controller is normal.	a. Check whether the solenoid coils at both ends are short-circuited. If there is a short-circuit, replace the coil, and then replace the circuit breaker of the feeding drive controller. b. If a failure occurs, replace and reprogram the programmable controller. c. If necessary, parts or controllers should be replaced.

SECTION 11 SPARE PARTS

PART DESCRIPTION	PFT PART NUMBER	QTY	MANUFACTURER	MANUFACTURER'S PART NUMBER
Level One Spare Parts (Maintain this minimum inventory of parts for standard mechanical wear items on the machine.)				
AC208-500V To AC220-4KVA Transformer	MDS025730006	1	Murr	86156
2KWServo driver	MDS025330063	1	OMRON	R88D-1SN20F-ECT
2KWServo motor	MDS015330003	1	OMRON	R88M_1L2K030C_S2- AC400
